The Depths Of The Sea
We are a team of ocean explorers in the team we have Tyler, Noah, and Grace. We are all interested in finding a mysterious ocean creature off the coast of Japan which is in the North Pacific Ocean.
The way we will go deep into the sea is by taking a boat called Erode out into the North Pacific Ocean with a crew above the sea to check on us and to keep the boat safe. A submersible called Eros is attached that can go 5,000 meters under the sea.
The first part of our expedition was entering the sunlight zone. The sunlight zone is very bright. This zone is two hundred meters deep and our favorite fish the Spotted Eagle Ray. It was stunning to watch it swim in the ocean.
After the sunlight zone we went deeper into the twilight zone which started to get dark and we had to turn on our lights. The first thing we saw was a Firefly Squid and a Vampire Squid. The depth of the twilight is two hundred meters to one thousand meters below sea level.
The next zone is the midnight zone it is darker than the twilight zone so it was harder to see. The animal that we did see is the Goblin shark it was very aggressive and scary it was approximately nine feet and weighed about three hundred fifty pounds.
As far as we can go which is the abyss zone which is two thousand meters deep, we finally arrived to the sea monster. We quickly started to rise back to the boat. The monster grabbed the surfboard and we took great photographs. My team named the sea monster Anufolole which is said to be at least 10 meters long. We finally made it to nowhere the submersible got hit with a powerful punch. It was a gigantic sea monster. It was a fun adventure.
