Cincinnati Zoo Devastated By Loss of Endangered Sumatran Rhino

CINCINNATI (March 31, 2014) - “Suci”, one of the world’s rare endangered Sumatran rhinos, passed away late on Sunday, March 30. Surrounded by the keepers and veterinary staff who cared for her daily, she died at her home at the Cincinnati Zoo & Botanical Garden.

The female Sumatran rhino, born at the Cincinnati Zoo in 2004, was one of three Sumatran rhino calves born to mother, “Emi” and father, “Ipuh.” Suci’s keepers first became concerned about her when they noticed her losing weight several months ago. After careful research and hours of dedicated monitoring, staff began treating her for hemochromatosis, otherwise known as iron storage disease. Although hemochromatosis is extremely difficult to diagnose in a Sumatran rhino, Suci’s mother died from the disease in 2009. In humans it is a heritable disease and many of Suci’s symptoms were similar to those of her mother’s. A necropsy will be performed on Suci early Monday, but it will be several weeks before the zoo will have the final results.

“Today the Cincinnati Zoo has lost one of its most beloved and charismatic animals. Suci was a symbol of hope for her entire species, one that is quickly losing ground in the wild, and her absence will leave a great hole in our hearts,” said Dr. Terri Roth, Director of the Zoo’s Lindner Center for Conservation & Research of Endangered Wildlife and Vice-President of Conservation. “The international community has a great challenge on its hands. If we don’t act quickly, and boldly, the loss of this magnificent animal will be among the great tragedies of our time.”

For several months, scientists, keepers, and veterinarians at the Cincinnati Zoo have been treating Suci for the complex disease, while hoping for a complete recovery. Therapeutic phlebotomies, the treatment used on humans and in African black rhinos, were performed by Zoo staff and the early results were promising.

“Suci’s behavior and appetite had improved and we remained hopeful,” said Dr. Roth. “However, on Sunday her condition quickly deteriorated. Keepers and vets worked together tirelessly to make Suci comfortable but ultimately there was little that could be done.”

The three Sumatran rhino calves born at the Cincinnati Zoo were the direct result of years of breakthrough research by scientists at CREW. The Cincinnati Zoo was the first place to successfully breed this critically endangered species in captivity in over 112 years. To date, only one other calf has been born outside of Cincinnati, at the Sumatran Rhino Sanctuary in Indonesia, where Indonesian veterinarians employed the breeding protocol developed by CREW scientists. That calf, named “Andatu” was sired by the first calf produced at the Cincinnati Zoo “Andalas.” The Los Angeles Zoo sent Andalas to Sumatra in 2007 to help bolster the Indonesian program. Now, the only Sumatran rhino living in North America is Suci’s brother “Harapan” who also resides at the Cincinnati Zoo. Harapan moved to the White Oak Conservation Center in Yulee, Florida in 2008, and later moved to the Los Angeles Zoo, before returning to Cincinnati in July of 2013.

“The Cincinnati Zoo has been committed to saving the Sumatran rhino for 25 years, and we plan to keep working to ensure this species will still be around a century from today,” said Thane Maynard, Executive Director of the Cincinnati Zoo.

Considered the most endangered of all rhino species and perhaps the most endangered large mammal on earth, it is estimated that no more than 100 animals exist, almost all on the island of Sumatra in Indonesia. The primary cause of the species’ decline is the loss of forests due to oil palm, logging and human encroachment, even in some national parks, and poaching for its horn, which some Asian cultures believe contains medicinal properties. Today, there are only nine Sumatran rhinos living in captivity worldwide.

The Cincinnati Zoo works closely with the Indonesian Ministry of Forestry, the Indonesian Rhino Foundation, the IUCN Asian Rhino Specialist Group and the International Rhino Foundation, to protect this species in the wild, and also propagate Sumatran rhinos in captivity. Both approaches will be necessary to secure the future of this critically endangered species for future generations.

“Although we remain proud of the many contributions the Cincinnati Zoo has made to Sumatran rhino conservation, especially to the captive breeding effort, the loss of Suci is a devastating blow to the program,” said Dr. Roth. “The best way we can remember and honor her is to work even harder to save this incredible species – if we let them disappear, the responsibility will rest heavily on all of our shoulders.”

###

The world famous Cincinnati Zoo & Botanical Garden was rated the #1 attraction locally and one of the top zoos in the nation by Zagat Survey. It was recognized by Parents Magazine as #7 on the “Top 10 Best Zoos for Kids.” It has also been recognized by Child Magazine as one of “The 10 Best Zoos for Kids.” Over 1.5 million people visit the Zoo’s award-winning exhibits, and more than 500 animal and 3000 plant species annually. The Zoo is an accredited member of the Association of Zoos & Aquariums (AZA) and the American Public Gardens Association (APGA), is internationally known for its success in the protection and propagation of endangered animals and plants, and engages in research and conservation projects worldwide.
