

In the unlikely event of an emergency, we will not leave until the work is done. Enbridge has pledged to take full responsibility for the clean-up of any release in Michigan or anywhere along its pipeline system. The company's financial position and past follow through on our commitment to Marshall, Michigan support this pledge.

- Enbridge paid the full \$1.2 billion cost of the July, 2010 Marshall spill in Michigan on Line 6B even though it exceeded insurance coverage.

Safety – and the prevention of incidents – is our number-one priority. Modern-day preventative maintenance and inspection technology make accidents, especially large events, highly unlikely. In the unlikely event of a leak, Enbridge has the emergency response equipment, training, and expertise to respond quickly and effectively. If this were to occur:

- Our Control Center would close remotely controlled sectionalizing valves immediately upon detection of a problem, with full closure occurring within three minutes of activation to isolate the affected section.
- We would rapidly dispatch a trained response team, including environmental crews who have a strong understanding of the products we transport.
- Under the oversight of federal agencies, Enbridge would then clean and restore the affected areas to avoid long-term impact to landowners, residents, and the environment.
